Software for developers

The devices S3 Control, S5 CommPro and S6 TrackPro can be adapted with JAVA applications to individual customer wishes and requirements. For the devices S4 CommPro X and S7 TrackPro X a Board Support Package (BSP) is available.

Sitec systems provides all the tools required to generate applications rapidly and with ease. To reduce development times, we can also deliver one- to two-day training courses to show you the basics.

Training for developers

Our training offerings, customised to your requirements, will help you reduce the time taken to develop your application. In just a few hours, you will find out and understand how our devices work and how you can develop your own applications for them. Each

course will take your specific needs into account. We can, of course, cover specific subjects where required. We can discuss with you whether it is best to hold the courses on your own premises or ours, depending on the need.

Training contents

Basics	Introduction to the hardware Structure of operating system
Setting up the hardware	Communication with the hardware Deployment
Introduction into the programming	Set up the development environment C Java
Sample application M2M	Oriented to the costumers wishes
Introduction to the BSP development	Extension of the operating system with own programs Kernel development
